Yes. I love it deeply. Just as it is. Why dont you bring up the quality while I try to remove the bugs I created last night ?

PS: My program posted earlier can be used as a tool to crash window 98 on purpose ! :-) Sorry about that one. It (seems) runs so smoothly on WinXP ...so I kind of hoped it would work on 98 also. Guess what ? I does, but only when used as a tool to crash it. Rudy, are you one of the guys on the Delphi team ? Maybe you can determine the source of the bug ? And comment on it ? The link is supplied in post from me dated today. Im to tired today, 24 hours straight, but I would guess the first problem is with the paths. Maybe windows 98 do not like Skin1*.bmp as a path? But fixed that, if trashed win98 completely, try to find the errors tomorrow, good night Rudy. Please dont put me in the killfile ? I promise to shape up the minute the Hyde gang stop acting like a bunch of greenfaced misfits god forgot about. I got news for you Randall. God doesnt care about HLA. She loves you anyhow. And when you get to heaven, you will be apointed the biggest computer you will ever have dreamed of, and it will bear the name LISA. And you can play with her as much as you like. Theres only one catch. You need to write an assembler first. (hmm...maybe its in the FileExists proc ?) Whatever, I look at it tomorrow. Initiate unwinding.....

To those of you who wrote software for cachin' machines.....Today , the power went all over my part of town. Security Guard told me : You cant shop now. But I have cach ! Cach man. (in norway that doesnt yet mean you're a criminal). –No way, he says : They cant open the registry boxes, they cant give change. – But I pay handsomly! And I dont care about the change, because my cat is screaming at me for food, allthough she just had a portion of fish that would end two grown men ! – Doesnt help ! (he laughs) Not at me, I realize that. He laughs at the whole situation. Look. The store is steaming with people, and guess what ? They are not looking at the walls, or the floor, deeply consentrating on getting out of there as soon as possible. They actually talk to each other. I hear laughter inside the store. A good vibration spreads. Hey, they are having fun! How wonderful ! Then I think. Why cant every day be like that, or at least 2 of the weekdays ? Look at them, they are existed and glad to meet each other, in a dark store, in the middle of a buisness day. The lights are gone, and they are happy. No need to hide. Someone makes a comment. A comedian is born inside the store, and gets lots of friendly laughter. Can you picture it ? For a minute there, I wanted to run into the store and join them. Beeing together with basically alive people. If only for a few minutes. But I walk away. Running my errand in the small shop in front of the center. I found they are also computers and cards now. I just want sigarett paper now. My options have narrowed. I go in. The small shop is empty. The lights starts blinking....–Hey get me 100 papers as fast as possible. I pay almost \$3 or closer to £2. I get out

Re: tiresome ranting

alt.lang.asm: Re: tiresome ranting

thinking, maybe the light should come off more often...its fun..or at least, these people, normally dead, think its great fun. I just shake my head. I want to download alt.lang.asm and see who gets a point in the ongoing battle between Randy and Betov. Of course the winner is allready settled, but the fight is not over. Oh there is Randal; got an uppercut, by saying : RosAsm has week handling of user equates over 50000 ? You dont know shit about programming! Then Betov, shakes his head thinking (poor proffessor) and says : So where is your 2 mega asm source ? And Randall is flattened for all eternity, knowing he could never pull of that in such short time. So he basically start arguing against assembly. Who needs assembly ? All you need is <http://...pdf> The standard library have all you need and more, and if that doesnt please you, look at my other Standard library....and if that doesnt please you then look at my linus Standardlibrary...and if that doesnt please you look at AoA. And if that doesnt please you. Start using 1000 levels of nested macros. HLA can do sleeping 8ts of nested macros, and can compute 50000 user equates in 7.8 seconds...on a 2Giga herz machine. And it can du nested inc like this

```
Sub ( inc ( call KillMeNow( ( mov edi 00_A0A rep scasb( shl (mov ( inc( inc( inc( inc( ebx) ))), edx, ecx, TrashMem32), 2) ) ) ), 50000)
```

Dont worry. The parenthesis will keep things in order. And if you dont like verbose, and unessesary typing you can write :

```
Sub(inc(call KillMeAtOnce((mov edi, 00_A0A rep scasb(shl(mov(inc(inc(inc(inc(ebx))))),edx,ecx,mem32), 2))))),50000) and save a few chars in the source.
```

Please Rudy , not the killfile.
