My linux box is redhat enterprise edition 8.
g++ is version 3.4.1

I have a has table that I plagerized many years ago that is written in c. Everything that gets is:
void* htGet(char*,void*);

All keys are char* and all values are void*. Works ok but would like to reduce the amount of code I maintain and test.

I was looking into writing a template for a hash using map as th base. First I decided to do a find in /usr/include for *hash* and found hash_map and stl_hashtable. I moved to the /usr/share and did the same find, looking for documentation, and found no reference to these 2 files.

WHere is the stl documentation?

I don't want to write or maintain any tools I don't have to.
