

Is this board a good alternative to the PC?

Hi,

I have seen the board described in this link.

<http://www.seventech.it/english/merlinoboard/2.php>

I think that its a good solution to realize an embedded system with VGA output, in that cases where, to use the PC, is not convenient.

I have seen that it's available also a dev kit to develop the code in C++ and it is not necessary to use an operating system.

How is it possible to work with a system without operating system?

You thing thought of it? Is it really a good product? Who has used this board?

Thanks

Renato
