I am writing a program using GTK+ 2. I'd like to register it with KDE's session manager, ksmsserver, so that it will start up once KDE is restarted. How should I do that?

We don't know. If there is a KDE newsgroup or mailing list or web site, they would probably know there. GTK and KDE and session managers are not part of the C language, so we don't discuss them here.

IOW:

Off topic. Not portable. Cant discuss it here. Blah, blah, blah.

Obvious the Knome start-up sequence has got to be off-topic. It doesn't matter what language you write your programs in, the method for launching them at startup will be the same. And appropriate to discuss in a Linux group.

GTK+ – well this needs to be off-topic as well. The reason is that there are simply too many C libraries for GUIs, signals processing, graphics, etc to reasonable handle them. If C were a little niche language matters

Re: Session management

would be different.

Please don't post this cookie-cutter with Asperger's links to reasonable off-topic redirections. Just let the thread die or, if you don't like the tone of the redirection and really must, say you don't like the tone.
