It could be that you are not loading the flexgen shared object library, libflexgen.so. This shared object can be loaded automatically if you place it in a subdirectory called rmcoboso/ in the same directory as the RM/COBOL runtime (runcobol). If you do not wish to load the libflexgen.so automatically, you call always use the `-l` command line option to specify the library. The runtime will report the loaded dynamic libraries if you execute with the `-v` command line option (e.g., `runcobol foo -v`).

If you can find the flexgen shared object library and are still getting a procedure error 204 then you probably cannot find a COBOL subprogram. You can use the RUNPATH environment variable to specify the directories where the COBOL programs (and data files) reside.

I am using the Flexgen cobol generator on a Unix computer. I have a program that I want to run overnight in a batch file. I have RM Cobol and I thought I could just type "runcobol programname.cob" at the prompt and it would work. But I am getting Cobol procedure error 204. This error seems to be that it can't find all the subprograms or something else that it needs to run.

Can anyone tell me what else I need to do to get this to run? A path statement? A parameter in the runcobol command? Thanks.
