I have a form with an ADOconnection and two tables.  
The form is created on the fly (ie. not auto created).  
When i close my application i get an Access Violation Exception unless  
the ADOconnection Connected property is set to true at \*design time\*.  
Set to True at design time, no exception.

I have used ADO in nearly every big app I have ever wrote and never had  
this before.

Now all I can think is because there are more than one instances of the  
form something odd is happening. Why settings connected to true should  
solve this i dont know.

Maybe an application cannot handle more than one ADO connection at once  
to the same database – ???

Any one any ideas?

Cheers Pete.
