Hello,

I write this message because it might be usefull in the future:

I followed these steps to get the web application working on Windows XP 64 bit Edition with Delphi 2006:

Step 1:

Start the World Wide Web Publishing Service in "Administrative Tools->Services"

Step 2:

Enable ASP.NET 1.1, 32 bit version:

```
C:\WINDOWS\Microsoft.NET\Framework\v1.1.4322>cscript
%SYSTEMDRIVE%\inetpub\admin
scripts\adsutil.vbs SET W3SVC/AppPools/Enable32bitAppOnWin64 1
```

Step 3:

Install ASP.NET 1.1:

```
%SYSTEMROOT%\Microsoft.NET\Framework\v1.1.4322\aspnet_regiis.exe -i
```

Step 4:

Allow "ASP.NET version 1.1.4322" in "Administrative Tools -> Internet Information Services Manager -> Web Service Extensions"

This link from microsoft contains more information how to get different asp.net versions working:

<http://support.microsoft.com/kb/894435>

Bye,

Skybuck

INTRODUCTION

This article discusses how to switch between the 32-bit version of Microsoft ASP.NET 1.1 and both the 32-bit version and the 64-bit version of ASP.NET 2.0 on a 64-bit version of Microsoft Windows.

When you install both versions of ASP.NET, you may receive error messages if you do not perform steps to enable each ASP.NET environment to run in Microsoft Internet Information Services (IIS) 6.0. For example, when ASP.NET is not set up correctly, you may receive the following error message from a Web page:

Service Unavailable

Error messages that are similar to the following may be logged in the Application log.

Event ID: 2268

Source: W3SVC-WP

Category: None

Description:

Could not load all ISAPI filters for site/service. Therefore startup aborted.

Event ID: 2274
