I am trying to figure out why Delphi and ADO are having a problem selecting data from Sybase database.

I am trying to run a query like this "Select \* from Orders" but I get Unspecified Error. But if I identify the columns like "Select ID, OrderDetail, OrderQty from Orders" it works just fine.

Does anybody know why and how to solve without the column names? I would like to use Select \*.

Delphi 7 / Sybase SQL Anywhere 8.01.

Thanks,

Chad
