

Truncation of Argument with ADo Components

Hi all,

I have encountered an interesting and frustrating problem with the ADO components in D7.

Specifically, when I pass a string argument which is destined for an image column in the DB into a parameterised INSERT query, only the first character finds its way into the column. I am using a TADOCCommand component to do the insert. I've had this problem in the past, and overcome it by using a stored proc which accepts a VARCHAR input parameter, the argument of which is posted into an image column. I would, however, like to solve this problem without resorting to using a stored proc.

I have taken a look at the value of the parameter in the IDE before I execute the INSERT statement, and it is complete, but only the first character ends up in the DB.

Does anybody have any ideas?

The DB backend is MS SQL 2000 Enterprise.

Regards,

Norman
