I have a access (mdb) file with the following table and field features.

TEST_TABLE

a Text(128)

In my Delphi appl. I would like to be able to save a byte array of 128. (var a : array[0..127] of byte;)

In TADOQuery component there is no way of saving an array of bytes. If I manage this for mdb I think I can use the same technique for other DB using ADO components.

Is there any way of doing this ?

If yes, how ?

A code snippet is appreciated.

Thanks in advance
