That's probably not bad for Access. How does the user get 1154 changes into the system without being asked if the "want to save" ? Maybe if they app forced them to save more often the time wouldn't seem so long. You can check the ado recordset to see how many "changed" records are there and force an update ever 100 or so records. If done inside a transaction, you would have the opportunity to rollback the whole set ..
