

Parameterized Query No rows effected

I have a parameterized query of the following form

```
UPDATE MyTable
SET field1 = :Param1
WHERE field2 = :Param2 AND
NOT EXISTS (SELECT field21 FROM MyTable2
WHERE (field21=field1) AND (field22 <> :Param3) )
```

but it mysteriously does not update anything when executed.

All parameters are ftInteger, input direction, set to integer values before ExecSql. Executed within a transaction after another query that updates MyTable2 – could there be an issue of it not seeing these changes? Yet a similar query with Param1, and Param3 replaced by fixed numeric values in the SQL works perfectly (updates the records expected), as does a non-parameterized query building the SQL text dynamically.

I just can't see what is wrong with it. Any ideas? ADO onto mdb file via Jet 4.

Dave
