Hi all.

Has someone managed to use ADO and nested tables in oracle? we are using oracle ADO driver, delphi 7 Oracle 9i.

If I do "select * from my_table" and one of the columns of my_table is a nested table, i get the old error "ROW0004 invalid data type". I did a test with BDE (i know... sorry but after all it was only a test)... and it does recognize the column and declares it as TDataSetField, is there a flag on the driver that allows ADO to recognize this feature?

MrEd
