Yes I it is modify the Key and I dont own the trigger to modify it. So can I do a server side cursor? I have never done it before what is the ramifications?

Thanks for the responce

I am getting the Following error "Row cannot be located for update. Some vales may have been changed sine it was last read. I am using Delphi 6, on SQL 2005 Database with the standard ADO tools that came with Delph and a TAdoDataSet Component. The Error occurs when post is called. I have read the google posting. I have tried adding SET NOCOUNT ON to the begining of the Trigger I have tried in the Before and After Post placing TBL.Properties['Update Criteria'].value := adCriteriaKey all with no luck I looked at an ADO based replacement but I can not read Russan. Any thing i have not tried or replacement ADO tha will work and I can read?

What is your trigger doing?

It sounds like it is modifying a value in the key and that is never going to be compatible with editing from a clientside cursor.
