Hi,

I want to use Recordset external to the ExecuteComplete event.

I created my own recordset and assigned in the event as MyRecordtdset := Recordset.

It seems to be OK, but it could just be luck. However, it does not have methods like FieldByName, and I can't seem to determine field types etc. It just seems to limited.

So I thought that I would use a table and clone the recordset, but i can't do that either.

Probably my limitations are getting in the way here, so if anyone knows of some good reference material on this subject, please let me know.

Regards,

Andy
