I forgot to mention that this is installed on a machine running Windoze XP Pro.

I just noticed an earlier posting (9/17) from somebody experiencing some of the same problems. We have this running on another machine under Windoze 2k Pro and it works just fine.

Perhaps there's something in XP that screws up parts of Delphi?

Just like the earlier poster said, NONE of the library paths were set up after I did the install; my 3rd party component libs had trouble finding built-in stuff; I have to manually set up lib paths to EVERYTHING, and add explicit search paths in the project when I've never had to do that before. There's something really screwy with this installation...
