Is there a rule I can follow here?

I use a naming convention to make this easier to work with. I name properties and variables so that it is obvious what is being passed back to the caller etc. I use the "Ref" suffix for anything that passes a reference to an object that shouldn't be freed. That doesn't always work but it often does. I find that I normally work with one primary structure that contains all the objects and then I have other objects that simply reference the contained objects.

HTH

Cheers,
Kevin.
