I did try to declare them, then put them down below with no success. I take it that there just isn't a way to do it.

Died-in-the-wool *Pascal* programmers *expect* the procedure body to be defined before it is used. Anything else is a habit gained from use of other languages and is confusing unless used consistently. The true intention of the 'forward' keyword was just to handle the exceptional case of mutually recursive procedures (i.e. a calls b and b calls a).
