Multiple people working on the same system, yes. The architecture seems to dictate that you have to take down the entire site to update parts of it.

I don't know the answer to this.

Another question is how it scales. It doesn't look like you can easily run a farm to serve massive amounts of hits.

Here is a quote from thier manual:

"The Morfik WebOS AppsBuilder brings about a whole new paradigm shift in the development of applications. Oddly enough, this shift brings application development much closer to what it was, with the visual tools for creating Windows applications, than the more recent crop of tools designed for creating pages.

An additional change brought about the WebOS AppsBuilder is that it allows web applications to become desktop applications. With virtually no additional work an application created with the Morfik WebOS AppsBuilder can be deployed as a desktop application running directly on any desktop computer. The same application can be deployed to a server and work as a departmental or small business centralized application. It could also, through a rebuild process, target deployment onto a server farm and handle huge amounts of traffic and concurrent usage in a corporate intranet or on high traffic web sites."
