I have exactly the same problem after actually compiling the application.
(first run is ok, so when using the "old" exe and debug info things are fine?)

Something seems REALLY broken now.. – outside the IDE the EXE runs fine, debug and release...

Codegear???? help?

Omg...

I'm having real problems after updating. I've tried repairing but to no avail. Here's the problem:

Any project seems to run when Delphi is first loaded. The second or third time I try to run the app, even a blank app, it fails with an error:

"The application failed to initialize properly (0xc0000005). Click OK to terminate"

I notice in the task manager that only 168k of the application has loaded. When I click OK I get a "project failed with AV message". Looking at the CPU window it seems to be full of ???? instructions (zeros maybe)?

If I then terminate the program, build and re-run I get the same "failed to initialize" message but the call stack is gives:

```
ntdll.dll  
ntdll.LdrInitializeThunk + 0x10
```

as the call stack. Note that this behaviour is with a blank project and all application compile and run as standalone exe's outside of the IDE.

The next thing to rule out is that my update was somehow corrupted so I'm going to try is to repair with the "delete install cache" checked. I'll

Re: Update #1 – Initialization Failure on Running Apps...

then repair again and I'm hoping that it'll download a fresh update.

If anyone has any ideas they will be greatly appreciated!!

Frustrated regards,

Steve
