K and P are network drives, mapped by you under your user account, right?

What makes you think the account that IIS runs under has access to your network drives?

I could have been a little more clear.

P: is a local hard drive

K: is a drive mapped to a shared folder on P:

When I tried it on IIS, it was running the P: server dll, and the K: client program. Because I had a new rad studio, am fairly new to vista, and new to IIS 7, I decided to reduce the variables and just make it a simple one function web service running as a WebAppDebugger server taking IIS out of the equation.

When I run the server and client from P: it works, when I run them from K: it fails horribly.

.
