Nice page Jason. very helpful. And heres an idea for someone who has some extra time on their hands. Write a program, that will use your info, and gather all the info you provided from a SOURCE machine, zip it up or some how package it up into a file or files. Then, use that program to unpack this info onto a TARGET machine. That would be a useful tool. In fact, I might even try it in the next few days if I can find time or would be happy to participate with someone else if they are interested.

I sort of did this already. It's not a program, just a couple BAT file. One run to get all the files out of installed system and compress them up. A second one to decompress the files and put them in the appropriate spots. It's what our automated build processes use to put Delphi 2007 onto the build machine.
