I would like to create a panel in a delphi form that shows the contents of the outlook inbox and/or sent box, and also allows the user to apply filters (e.g., show email only from customers (by comparing the email addresses in the delphi application's customer database to the outlook email addresses). Is anyone aware of a good third party tool for this or the best way to implement something like this (outlook api/ object model or similar)? Any help is appreciated.
