> *"Feature in Detail".*

Our official opinion about database "benchmarks" was made several times already: generally they are useless. Depending on which functions exactly and even how you test them often ends in completely different results. We've seen enough benchmark wars in this group and for everyone who wants a benchmark there are enough out there.

We offer a full working trial and a free lite version for everyone to download and when asked about performance our answer is: try it with your app. We simply can't tell people that we will be 10, 20, 50, 500% faster than the currently used database cause we simply don't know. We are doing a lot of comparisons and optimizations with all these featurerlists and available benchmarks. They are useful *for us* in the way that they show potential points to improve. We are happy with these for ourselves, but what counts at the end is if the customers are happy. And that they have to decide on their own and surely will not be if a promise doesn't hold up.

If someone wants to include NexusDB into a benchmark we have no problems with it as long as the source is available for every one to review and a place for discussion/explanation of it is offered. If we suck in a certain test we will try hard to get better in it ;)

hope this explains why we do not offer benchmarks and/or results.
