Hi,

I don't know if it handles Unicode, but I've using TPageproducer for similar purposes.

Users edit the HTML doc and just put tags like <#CUSTOMER_NAME> or <#INVOICE_NO>.

Before processing the TPageproducer.HTMLDoc property is loaded with the HTML and I just read the TPageproducer.Content and do what I have to do with it.

Processing of the tags is done in the OnHTMLTag event of the TPageProducer.

HTH, regards

Gerard.
