Well, others will disagree, I suppose, but I'm a great fan of Firebird. Firebird is an open source fork of IB 6. Firebird has an embedded version, and with that you get a single user database, without installing servers or other stuff. The only thing you need is a DLL in the same directory as your application. If (in the future) you want to switch to a full featured server, you just replace this DLL with the normal Firebird client, and a server somewhere in the network (could be your local machine, though).

The address is www.firebirdsql.org or www.ibphoenix.com

Regards, Diederik
