Era Soluzioni announces the initial release of DbUpdater 1.0

We're pleased to announce the availability of the DbUpdater32 1.0, an easy-to-use program which synchronizes database structures using the DbUpdater technology (<http://www.erasoluzioni.com/DbUpdater/>).

Our purpose is to disclose the DbUpdater technology to a wide range of user and get a feedback in order to improve our architecture.

What is DbUpdater32

DbUpdater is ideal for software farms which have the problem of taking the customer data structure synchronized with the actual database structure.

All the process is governed by a set of configuration files where is possible to specify which objects (tables, stored procedures, views, indexes, .) synchronize and how (create, modify, delete, .).

DbUpdater does not requires a live connection: when development team needs to update customers, it extracts the database schema (step 1), send schema to the customer and prepares the required sql instructions "on the fly" comparing actual database schemas with customer database structure.

In addition, the component can update databases which are installed in different providers. For example, if the actual database has been developed and maintained with SQL Server and if the customer provider is Sybase Adaptive Server Anywhere (ASA), the program can takes the two database synchronized.

If you are interested, visit the our site at

<http://www.erasoluzioni.com/DbUpdater/>. To download the DbUpdater32 for free, visit the <http://www.erasoluzioni.com/DbUpdater/dbupdater32Info.htm>

Any kind of feedback is welcome at
