Just curious ... why would anyone want to be able to display 100,000 rows in a grid ? ... who would have the patience to sit and scroll through so many lines and with 100 columns ? Wouldn't it be better to incorporate filter / search functions to control the scope of this data and thereby minimize the demands required both of the grid and any network loading ?

Andrew

Does anyone know of a Delphi grid that can be huge? I'm thinking 100 columns by 100,000 rows. I know that TStringGrid has the OnGetDisplayText
