FraserSoft are pleased to announce a new version of GenHelpPro, a help authoring application for software documentation and application help files.

This latest version adds the ability to import HtmlHelp files (.chm) into GenHelp so that existing help files can be ported to GenHelp. The existing structure of the help file is kept as is the Table of Contents. You can then edit the file using GenHelpPro's unique section editors to add all the features you expect from a help file.

Also added in this release is a Wizard to simplify importing of source files. This will automatically run the first time GenHelpPro is run.

GenHelpPro allows you to work with fully documented source files OR edit your own documentation based on creating a skeleton help file from existing source files and then adding documentation afterwards.

Once the documentation has been completed, GenHelp Pro allows the creation of many different formats and types of help files using a template system, all from the one file! This process may be further automated using command files to create a complete release of documentation for different IDEs or manuals.
