We are happy to announce the availability of NexusDB V2.07 PHP Extension beta2.

For the first release of the PHP extension we're targeting Win32 only, thus you won't be able to use the extension on any other operating system than Windows.

If you're interested please give it a try and report any problems to the nexusdb.beta.php group on our news server.

You can download a time limited (expires Dec 31st 2007) version from <http://www.nexusdb.com/showpage.asp?id=66>

The archive contains extensions for PHP4 and PHP5 (which is of course base requirement for the use of the extension), please read the readme for instructions how to install. It also contains a demo script showing most of the functionality which is modeled after the widely used mysql extension.

Beta 2 adds a PDO driver as well as ADODB_lite support files.

NexusDB is working on this project together with Alexander Telegin, who is the lead programmer for the extension and who will also be answering questions in the beta and support groups.
