I need to upgrade some applications that i have made in the past to use new components instead of the old one's that are used in the past. like TRx.... to Tjv.... and so one. Is there any tool that can help me with that. So i do not need to do this by hand?

GExperts has a feature to replace components

www.gexperts.org

This one i know, the only thing here is that it can do only one componente at a time. And i like to do it in a batch run all the know changes,

I recommend if you find it useful to also give a donation to the project.

Have a look at MassReplace:

http://sourceforge.net/project/showfiles.php?group_id=29749&package_id=53394&release_id=447573

Seems it uses a replace list load from a text file.
