Vadim Vinokur has brought this to us :

AnySQL Maestro operates via ADO. It calls OpenSchema to retrieve metadata, see http://www.w3schools.com/ado/met_conn_openschema.asp

There is no way to extract view/procedure/trigger bodies, manage users, grants, etc. Also OpenSchema knows nothing about DBMS specific objects, such as tablespaces, jobs, partitions, full-text catalogs, etc.

Also AnySQL Maestro strongly depends from OLE DB Provider / ODBC Driver you have installed. Some providers even do not return indexes and/or foreign keys. Check constraints are not returned correctly by any driver/provider.

Do you have a product like AnySQL where I can connect to a variety of database vendors and have full database management? I would like to avoid loading a dedicated tool for each database system I use.
