I think you're confusing enumerated values and "sets" of such values. Sets are defined by square brackets enclosing enumerated values. So square brackets are necessary only where a "set" is declared as the type of that variable.

The variable I was referring to is a value, not a set. But thanks for replying.

If you're unsure about sets, then they are worth looking into, particularly if you are involved in issues where individual bits are set as flags.

Alan Lloyd
