Yes, I have no problem in locating the path to the delete button. What I am saying is that, having used that button and apparently deleted the component, I could not store a component with the same name of the (apparently) deleted one.

In fact I initially stored on the Delphi "template" palette a frame with the name "MyFrm". After a while, I realized I wanted to make some changes to the frame. I could not find any other way to proceed than to delete "MyFrm" from the palette and store the modified frame. I tried using the same name, but Delphi kept saying that another component existed with the same name... (but I thought I had deleted it; in the template page did'nt show..).

I think to some Delphi bug. Or perhaps I am the bug...

I created a frame and stored it in the palette. Later I wanted to modify it,
but I did'nt find the way to replace it, neither to delete it.

To delete it I right clicked on the component in the palette, choose "property", got a list of component, highlighted my frame and clicked

the

delete button. Now the frame does not appear any more on the list, but trying to store with the same name the modified component, I get a

message

that it is already present.

Any idea guys ?

Re: How to delete from palette

Hi,

in german D5 you find it in Menu Komponente – Palette konfigurieren...

In english that might be Components – Configure palette...

It is the last item in that Menu box.

Regards

Heiner
