I use Turbo Delphi 2006 under Vista on a laptop.

I like it (except for the Help, which includes items for other languages as well) as I like D6.

But I have one problem that bothers me no end: every now and then the keyboard settings change and input of punctuators gets messed up. A quote will become a plusminus and that sort of thing. D6 under XP did this as well, but only rarely and I can then change the XP language settings back to EN to solve it. With Turbo Delphi 2006 in combination with Vista I am not able to do that. The only solution is to exit the IDE and restart it.

But it happens dozens of times per day ...

Can you explain what causes this behaviour, and then maybe: what solves it?

TIA

Tom

I suppose you have a non US Vista version (probably Dutch?).

XP (and I guess Vista) by default then installs two international settings, one with US international keyboard and one with (for example) NL keyboard.

Some applications tend to (for no apparent reason) then switch international and therefore keyboardsettings (at least MS Office does this).

If you can do without the other keyboard layout/settings, just eliminate them completely, so you remain with only one combination of language and keyboard setting.

Also there is some shortcut for switching keyboards and maybe delphi uses this shortcut also?

Hope this helps in any way.

Bart
