Well, after the official "uninstall" CVF 6.5 thinks array analyzer is still there and can't be upgraded so I guess it is brain surgery time.

In the Smores Schnaps episode of South Park, Eric Cartman said, "I hate you guys so very very much". I hope Bill Gates runs out of money.

He can give it to me. I'll buy IVF and fix it. The rest, I'll use to improve the spreadsheet and RTF widgets in GINOMENU...

Jim Klein <jameseklein@xxxxxxxxxxxxxx> wrote:

Hi,

I have a win 2000 pro machine. I have been running CVF with VS 6.0 Pro for years and compiling via batch Windows programs using Winteracter as a GUI builder and Graphics engine and doing everything via batch files and AUTOMAKE.

We just got 2005 and Intel Fortran 9.0 and 9.1. I have spent at least 3 days messing with various installations to try and build what we have built using CVF and VS 6.0.

It seems that things are not as well integrated in the VS2005 environment as they were with VS 6.0 and the documentation for IF 9.0 and 9.1 are not as well integrated into the help as they were in CVF and VS 6.0. That is probably not the main issue.

Mind you, I'm not trying to a flame. I have been controversial in the past but I'm trying to be a good citizen now. Honest guys. I'm trying to find out if it is the new tools or if it is my being a moron.

Re: Intel Fortran 9.0 and 9.1 using VS 2005

I'm looking for other views and inputs that might shed a little light on why things seem to have gone down hill wrt. the new VS 2005. I build stand alones so .NET is not an issue for me.

Lawson Wakefield has been most helpfull is sheading some light on the difference between building using WIDE (which works fine) and building using batch files and AUTOMAKE and the necessary changes to the environment variables.

I have guidance which I'm still dutifully following wrt the environment variables which point toward the linker.

I have Win 2000 Pro, SP4. EVERYTHING is up to date on the system. NORTON UTILITIES Windoctor has been use RELIGIOUSLY to keep things healthy. No viruses or spyware on this old boys system.

I have even removed VS 6 and CVF (and all environment variables to them) so as to make sure that conflicts in the location of linker files are not the issue.

Any and all comments, suggestions, or stories of your ports from VS 6 and CVF to VS 2005 abd IF 9.0 and 9.1 are willingly accepted.

Please don't think I'm trying to cause anyone any grief. 99% of the time I have problems, it is caused by my mis-understanding of issues which are transparent to everyone else.

Help and comments most welcome.

Sincerely,

James E. Klein
