I am also surprised to find out that Fortran variables are case insensitive! This makes me realize that tsoil(8) is TSOIL(8). TSOIL is an array declared and used at the top.

Ah. I hadn't thought of that possible confusion. I was thinking about much more subtle things.

I was recently working with a program that had been converted from upper case to lower case. In upper case it may make some sense to have variables named both LL and L1 in the same program. I don't recommend it in lower case as ll and l1.

But II becomes ii, which takes something that looks like a neo-colonial column and makes it look like a yeoman's variable.
