Thanks, good link! About GCC for embedded Linux, and good links.

But this is for a system running an RTOS without file system or TCP/IP, so an m68k-elf-compiler with newlib fits better.

I have mailed with Avi Stuart, who made the kit I first tried (<http://www.davehylands.com/avi/index.htm>). He says it should be possible to build C++ applications with his kit.

Will post an update if we find a solution, but you have to wait till I am back from vacation. :-)
