Chris Hills wrote:

The Digi price gives no indication on pricing on 50-100K from a "proper" disti. You can always do deals. I NEVER give the price of silicon. There are so many variables.

No indication? Seeing one part that costs \$5.00 in-stock Qty=1K and another that costs \$0.50 in-stock Qty=1K doesn't give you any indication at all about what the Qty=100K from whoever has the best price will be?

To the OP: Elan/EMC, WinBond, and SunPlus are the lowest cost parts if you ever get into real high quantity production instead of a measly 100K parts. And yes, they all sell bare dies that you connect through wire bonding.
