Hi,

I am under taking a project to build an LCD module which supports my Mother tongue (Malayalam). The available LCD displays in market only supports English.

What is the problem? Everybody must speak English.

Hi,

While there is nothing wrong in speaking english,we cannot expect everyone to know it.There are people in this world who dont understand english.Some displays give ADVERTISEMENT content localised to the language flavor in that location.I believe when your target customer is some one who dont understand english,you will not give the same statement you said here.

Regards,
