Yes. People have been using "humanocentric" in this thread (as you can see from the quote), so I just went with the flow.

And there is. Not in the substance, but in the structure.

Most houses are built from the same basic materials. Are all houses basically equal? Imagine a theatre and a small house both built from bricks, wood, steel and glass. Are they the same in their purpose and capacity? Or does the **structure** of how those materials are put together matter (and matter a great deal).

As we believe mind comes largely from the **structure** of the brain, it is that structure that matters, not the substance.

comp.programming: Re: What IS Intelligence

Apply that logic to, say, the Z80 and the latest from Intel.
Both made from silicon.... are they equal??

Structure is pretty important! (-:
