is it possible to determine how many files are in a given directory..

I have this photoblog, <http://www.francesdelrio.com/photoblog/blog1/photos.jsp>

not all pgs have same no. of photos, and I would like to know how to determine how many photos are in 'images' folder for each page, to then populate an array (or would it have to be a vector?)

also I want to associate each photo w/its caption, in that case it would have to be a hash-table? (or put everything in db?)

I have a new digital camera, I will be posting A LOT of photos from now on, am trying to figure out what best approaches are here...

thank you...

If you want the JPEG metadata then go to:

<http://www.drewnoakes.com/code/exif>
