Class files? Configuration
files? What files?

rizwindu wrote:

Either would do really. Could store the
results in a class and write
that. I can also store the results to a string
and write that to a
file.

Lew wrote:

On the face of it that doesn't make sense. What sort of
"results" are you
getting, and how to you envision that it would be stored to a
class? Are
these results bytecode?

If they are bytecode, then how do you envision they be
encoded into a String?

rizwindu wrote:

My results are a mix of strings, arrays etc. I can write them to a
file by outputting the text nicely. Or I can make a 'Results' class
that has some data structures to store all the things I need, then I
can create a new Results object, and save the results object.

That clears up my misunderstanding. You had said you'd save it as a "class
file", but y
