Hi All,

I have developed a Browser view plugin.

Following are its details:

- >On running the code, a browser opens in a new view called BrowserView. ->This browser is able to navigate through the internet pages using the back, forward, go, refresh, stop buttons.
- >If we type a url in the address bar and hit enter , the browser opens the required page.

However I am facing a problem when I try to load any URL by clicking on a hyperlink on any internet page. The browser does nothing when I click any Url.

Following are my observations when I tried debugging the program:

- > There are two methods: changing and changed implemented by the Location Listener. Whenever any URL is loaded, these 2 methods are called.

-> But when I click on any hyperlink of a page, the method changed of Location Listener is not getting called. This is because the selected url is not getting opened.

I am not able to understand that when any link is clicked in a Browser view, which event gets called and how is the selected url opened. I tried searching on net for the answer but did not get any pointers.

<<http://www.eclipse.org/articles/Article-SWT-browser-widget/browser.html>>  
<<http://www.eclipse.org/newsgroups/>>

If anyone has developed a similar plugin, can I get some pointers to the probable reason for why this is happening?

Re: Eclipse plugin : Browser View query

Thanks,
