<quote>

Java vs. Csharp I attempted to write a csharp version of sockSvr (java). After months of research, I aborted the project. Csharp (and .NET) does not have the equivalents of JDBC, beanshell (or other scripting languages), requires significant more code than the Java version, and can not run everywhere.

PS: sockSvr is an innovative, extensible, easy-to-use, database-enabled, username-and-password-protected, multi-user, multi-threaded application written in Java that can be used as secure web servers or platforms to web-enable any Java applications, to build distributed, client/server, ... applications. This industrial-strength application is light-weight. As a proof of its power and robustness, sockSvr has been used to power this web site since Feb 2002. As a demonstration of its extensibility, sockSvr has been used to build the issueMgr
