You can do a post request and append a variable like this:

```
<form method = post action = /servlet/process?pc1>
```

```
<form method = post action = /servlet/process?pc2>
```

Then, you write the code like this

```
if(request.getQueryString.equals("pc1")
{
    file://code for first form
}
else if (request.getQueryString.equals("pc2")
{
    file://code for second form
}
else
{
    //
}
}
```
