Is there any way to get the list of all data sources available to a session bean? E.g. if the server (JBoss) configuration has files mssql-ds.xml and mysql-ds.xml with jndi-name tags "MSSQLDS" and "MySqlDS" respectively, I want to pack Strings "MSSQLDS" and "MySqlDS" into a Collection and pass it to the client. The client will display the list of available sources and let the user choose the database to work with.

Is it possible at all?

TIA
