Hi!

Can anyone please point my any tutorial or www that can help my to write such an application:

I wont to write application with database placed on the server and 5 to 10 clients connected to this database. Clients can only writes data to database, and creating raports.

I wont to write this application in Java and use Jface interface.

Users should have theirs own logins with assign permissions . I wont to set wrights to CTabFolder. For example a have 3 CTabFolder :

- 1th – Add data (all users)
- 2 – Delete data (only administrator)
- 3 – reports (only users with given permission)

I have experience with applets and math class so I do not no how to start with application.

And two more question :

How in Java I can compile program to working in MS Windows application ?

What kind of freeware database should I choose in this project remembering that the construction of database is simple and the records should be near 50k.

Thanks for any help
