i am looking for a third party JAR + API which will help me...

to send params to a website from my java application and parse the web page .

i want to use a Third party jar or API,

though i can use HttpURLConnection class and send params to the website and parse the result , but this is tedious and i want to avoid this.

i have to parse FEW websites and have to DYNAMICALLY pick up results from those.

i am looking for a third party JAR + API which would help me to do this task in a handy way.

is there any package available ?

.
