Sorry if this isn't the right group but I didn't find a group dedicated to html. I'm creating a web page that includes a form with text fields. Is there a way I can pre-populate the text fields using the parameters received in the post request (i.e. the www.foo.com?myvalue=hello). So I can populate the "myvalue" text field with "hello" when the page loads. Just naming the text field "myvalue" doesn't seem to do it.

Thanks, and sorry again for not being completely on topic

–Robert
